[ATGTGGCCTTTTTTTTTTTTTTTTTTTT] double-stranded cDNA was ligated to a Drail adaptor [TGTTGGCCTACTGG], digested and cloned into dstinct Drail sites of the pME18S-FL3. Xhor sites just outside the Drail sites can be used to isolate the CDNA insert. Size selection was performed to exclude fragments <1.5 kb. Library was constructed by Sugano et al. (University of Tokyo, Institute of Medical Science). Custom primer for sequencing: 5' end primer [CTTCTGCTCTAAAAGCTGCG]]

Reptide analogues of human myelin basic protein - useful for treatment of multiple sclerosis

Disclosure: Figure 1; 61pp; English.

Deptide analogues comprising at least seven amino acids from residues 86-99 of human myelin basic protein (MBP), can be used to treat multiple sclerosis by competing for the binding of native MBP peptide to MHC and by not causing proliferation of an MBP reactive cell line. The peptide analogues also inhibit the induction of experimental allergic encephalomyelitis (EAE) by MBP in rodents.
                                                    Myelin basic proteins (sequences R48592-96) and cattle proteolipid protein (R48592) elicit the release of TGF-beta from suppressor T-cells and target the T-cells to neural tissue under cytotoxic attack, thereby reducing neurological disease, e.g. HTLV-1 associated myelopathy, tropical spastic paraparesis and HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Proteolipid protein; myelin basic protein; retrovirus; neurological disease; by-stander antigen; TG:-beta; transforming growth factor-beta; T-cell; T-lymphocyte; myelopathy; paraparesis; human immunodeficiency virus type 1.
                                                                                                                                                                                                    Treating retroviral associated neurological disease - lof by stander antigen, causing release of transforming factor beta from suppressor T cells

                                                                                                                                                   Homologous peptide analogues of human basic myelin protein - used for treating multiple sclerosis. Disclosure; Fig 4; 26pp; English. The sequence is that of human basic myelin protein (BMP). Fragment: of this sequence are claimed (see features) which are able to neutralise anti-BMP antibodies and are thus useful in treatment of multiple sclerosis. The fragments may be prepd. synthetically and avoids the dangers associated with the use of the natural protein, e.g. transmission of neuroviruses. Also the peptides are too small to be immunogenic.
                                                                                                                                                                                                                                                                                        29-APR-1993.

The native human 21.5 kDa foetal isoform (W00399) of myelin basic protein, MBP+X2Cy881, includes an exon 2-encoded region (X2) that may contain an epitope involved in the pathogenesis of multiple sclerosis (MS); the X2 region is not found in the MBP of healthy adults. Recombinant MBP+X2, or variants modified to improve bacterial expression (see also W06107), can be produced in a large scale in bacterial hosts. They are useful for assaying T-cells for responsiveness to MBP epitopes and can be used as therapeutic agents that act by inducing T-cell responses, including anergy and apoptosis, as a means of treating MS. A 21.5 kDa foetal isoform (W06107) of myelin basic protein, MBP+X2Cys81/bact., is the product of a DNA construct (T41896) based on the human foetal MBP+X2Cys81 isoform (W00399) but utilising bacterially-preferred codons in place of the native human codons (see also T41889). This increases prodn. of the MEP in E. coli by at least 50%. Recombinant MBP 21.5 polypeptides (see also W00399 and W06108) are useful in the clinical assessment, diagnosis and treatment of MS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-PSDB; T41896.

A 21.5 kDa foetal isoform (W06108) of myelin basic protein, MBP+X2Ser81/bact., is the product of a DNA construct (T41897) based on the human foetal MBP+X2Cys81 isoform (W00399) but utilising codons that are highly expressed in bacterial genes 1 place of the native codons (see also T41889) and incorporating sequence coding for a hexa-histidine tail. This allows large-scale prodn. and purification of the MBP in bacterial hosts. Recombinant MBP 21.5 polypeptides (see also W00399 and W06107) useful in the clinical assessment, diagnosis and treatment of MSP Sequence 203 AA;
                                                                                                                                                                                                                                                                                                                                                                                MP4 chimera (MBP21.5-delta PLP4 fusion).

Claim 34; Page 110-112; 156pp; English.

CMP4 chimera (W06103) is a fusion protein composed of human myelin CC basic protein (MBP) foetal isoform MBP21.5 (see also W00399) and CC delta PLP4 (W06101), a proteolipid protein (PLP) mutein that lacks CC all 4 hydrophobic domains of native human PLP (W06106) but CC includes PLP epitopes associated with multiple sclerosis (MS). It CC can be expressed in E. coli transformants using a DNA construct CC (T41893) contg. the MBP21.5 delta PLP4 gene fusion. MP4 chimera CC and other novel PLP/MBP21.5 polypeptides (W00399-400, W06101-08) CC are useful for the clinical assessment, diagnosis and treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of MS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MP3 chimera (W06102) is a fusion protein composed of human myelin basic protein (MBP) foetal isoform MBP21.5 (see also W00399) and delta PLP3 (W00400), a proteolipid protein (PLP) mutein that lacks hydrophobic domains 1, 3 and 4 of native human PLP (W06106) but includes PLP epitopes associated with multiple sclerosis (MS). It can be expressed in E. coll transformants und NA construct (T41892) contg. the MBP21.5-delta PLP3 gene fusion. MP3 chimera and other novel PLP/MBP21.5 polypeptides (W00399-400, W06101-08) are useful for the clinical assessment, diagnosis and treatment

Claim 36; Page 115-117; 156pp; English.
MMOGP4 chimera (W06105) is a fusion protein composed of human myelin basic protein (MBP) foetal isoform MBP21.5 (see also W00399), the extracellular domain of human myelin oligodendrocyte glycoprotein (MOG) and delta PLP4 (W06101), a proteolipid protein (PLP) mutein.
MBP21.5, PLP and MOG are all recognised by autoreactive T cells from multiple scierosis (MS) patients. The chimera was produced using a DNA construct (T41895) obtd. by inserting a sequence encoding the MOG molety into MP4 chimera DNA (see also T41893). MMOGP4 chimera
                                                                                                                                                                                                       (ALEX-)

PM4 chimera (W06104) is a fusion protein composed of delta PLP4 (W06101) and MBP21.5 (W00399). Delta PLP4 is a proteolipid protein (PLP) mutein that lacks all 4 hydrophobic domains of native human PLP (W06106) but includes PLP epitopes associated with multiple sclerosis (MS). MBP21.5 is a foetal isoform of human myelin basic protein (MBP) associated with MS. PM4 is in reverse orientation to MP4 chimera (W06103). It can be expressed in bacterial host cells using a DNA construct (T41894). PLP polypeptides (see also W00400, W06101-03 and W06105) can be used in the clinical assessment, diagnosis and treatment of MS.
                                                                                                                                                                                                  (ALEX-) ALEXION PHARM INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          R30736;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immune response such as auto immunity
Claim 30; Page 68 + Fig 7; 93pp; English.
A method is claimed for the prepn. of a pure major MHC-peptide complex. The MHC component is a Class II glycoprotein of the and the peptide comprises amino acids 1-14 of MBP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PT with antigent peptide(s) and label or toxin, used to target
pT antigen specific T helper cells
pS Fig 7; 74pp; English.

CC The patent claims complexes of formulae (1), (II) and (III) which are as
pS Fig 7; 74pp; English.

CC follows: (I) X - MCH - peptide; (II) MHC - peptide - X; (III) MHC -
pC follows: (I) X - MCH - peptide; (II) MHC - peptide includes an
pPT instruction of the major autoimmune diseases, including
pPT instruction of the major autoinmune diseases, including
pPT instruction in the complexes which can be used to
pRT candidate peptide for insertion in the complexes which can be used to
pPT instruction of mice which develops experimental
pPT in p94717 is with the substitution of the residues above the
pRT and an in p94717 is with the substitution of the residues above the
pRT and an in p92226.

CC camence in Fig 7. The sequence without substitutions is given in p92226.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
